

Lubecore Technical Announcement

20.253 Progressive Block Plug Update

Lubecore is pleased to introduce an upgrade to the 20.253 plug. This plug was first introduced to provide the ability to torque progressive plugs into blocks without stripping the internal wrenching hex. The design of this plug has been enhanced with the addition of a larger washer face. The plug is now also featuring the zinc nickel plating that common on other Lubecore steel fittings. This new configuration has passed burst pressure tests to 6000 psi which is more than 2X the progressive pressure relief valve setting. The recommended torque for these plugs is 180 in-lb (20.3Nm) Figure 1 shows the enhanced 20.253 plug.
