

Lubecore Technical Announcement

Modular Progressive Pump Upgrade

Lubecore is pleased to introduce an upgrade to standardize the installation method of our Modular Progressive pumps. This upgrade focuses on reducing the amount of space taken by the pump to allow for a more compact install. When a single element is installed, the element is to be placed on the left side of the pump which is situated above the timer. When two elements are present, the smaller element is to be installed on the left side of the pump whereas the larger element is to be placed on the right side of the pump. The benefit to this is that if a pump ever needs to be replaced, main lines will be situated in the same area.

Figure 1

Modular Progressive Element Placement

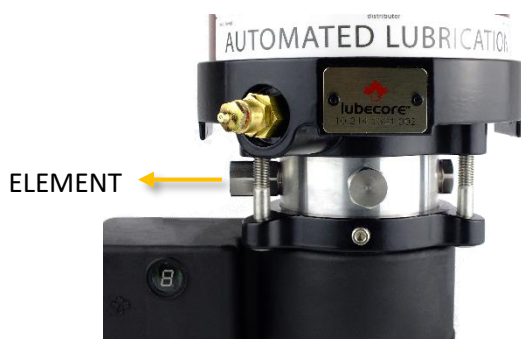

Figure 2

With a single element pump, the element is placed on the left above the protruding timer body.

Figure 3

1

With a double element pump, the smaller element is installed on the left above the protruding timer body while the larger element is installed on the right side of the pump. This will allow for pump swaps to be consistent with older products.
