

## Introducing the New MKII MHT - Mobile Heavy Timer

On heavy equipment installations, i.e. loaders and excavators, 24 volt, we have had occasional events with the timer “reverting” . What happens on occasion is that a timer programmed for example for 5 minutes ‘on’ and 30 minutes ‘off’ would all of a sudden “revert” back to default settings. i.e. 3 minutes ‘on’ 1.5 hours ‘off’ - (the time all timers come factory programmed for). It was a very intermittent problem and two machines with the same model number i.e. (CAT 980), running side by side it might happen to one and never to the other. After several attempts to find the cause of this happening, a fix was found and tested in the field.

The new timers were installed on machines where we had known “reverting” problems. After installing the timers on several of these machines for months it did not happen again.

Our first production run of 250 of this new timer is now in stock - **Part # 12.036**

The timer utilizes several extra measures against different kinds of interference: Voltage spikes, electromagnetic and radio signal interference. The timers are protected now by “opto-couplers”.

The same dongle and software can be used. The timer is in a grey box to be able to easily differentiate it from a 12.016 Truck Timer, which is black.

We recommend this timer for all Mobile Heavy Equipment installations.
