

20.225 Elbows

It has recently come to our attention that we have an elbow fitting which can be used with the Korilla hose to make a cleaner installation. This elbow fitting is not utilized enough in our kits. This communication is to ensure our valued customers know we have this fitting available.

Our most common configuration at the zerk when using Korilla is to use a 20.223 with a 20.208 and a 20.003 (see picture below)

A better combination is to use the following configuration either at the grease zerk or coming out of the Spyder pump for instance.

20.225 with a 20.208.

- There is actually a slight savings going with the 2 fittings instead of 3.
- It is easier to work with.
- It makes for a nice neat installation. For example when coming out of a Spyder pump with Korilla hose, you can get the Korilla hose directed back towards the frame rail and keep all the lines bundled nice and tight.
