Lubecore Communication

Subject: 12.027 Mk2 Trailer Timer Updates:

Lubecore’s technical department in cooperation with its extensive distributor network has come up with the next evolutionary step in trailer timer product development.

All Mk2 trailer timers are now epoxied with a transparent, mildew, corrosion, acid and heat resistant compound that encapsulate all the electronics mounted on the printed circuit board. Effectively encasing everything in a polymer that sheds condensation and dirt like water off a ducks back, and acts as a shock absorber alleviating any possibility of damage from vibration.

Deutsch DM 12 pin connectors with potted wire assemblies are now standard on all Mk2 trailer timers, allowing for one universal main harness assembly to be used while installing on a variety of equipment. Versatility and durability in one serviceable assembly.

Along with the updates to the Mk2 Trailer timer comes a new “T” style trailer timer mounting plate that has been designed to allow moisture that has penetrated the enclosure to be directed down and out of three specially positioned and protected vents that allow draining of the timer enclosure.

Lubecore is determined to provide the best and most cost effective solution to your lubrication needs. With our ongoing commitment to service and product design,

Lubecore is the Next Generation Lubrication Solution
