

## Lubecore Technical Announcement

### Steel Fitting Coating

Lubecore is pleased to announce that steel fittings manufactured by Lubecore will now feature a zinc nickel sealed plating rather than the yellow zinc dichromate plating we have used for many years. Lubecore is making this change to increase the corrosion resistance of the fittings we manufacture. Although the yellow zinc plated parts have served us well, we are excited to make a product improvement that will serve us even better. To the right you can see an example of the plating you are familiar with receiving from Lubecore.

*Figure 1 Current Yellow Zinc Plated Part Example*

The incorporation of the sealed zinc nickel coating will happen as we deplete the stock of yellow zinc plated parts meaning that we shall continue to use our stock of yellow zinc parts and begin providing zinc nickel plated parts when yellow zinc parts are used up. You can expect to see zinc nickel plated parts starting with the part numbers, 20.061 and 20.062 which part number such as 20.001, 20.002, 20.003 and 20.236 following soon after. To the right you will see what you can expect to see provided from Lubecore in the near future.
